NAVA PRAHARSHA
ANALYTICS ENGINEER
Jersey City, New Jersey | (475) 231-9390 | npraharshaaj@gmail.com | linkedin.com/in/navapraharsha

Data Analyst with 4+ years of experience turning raw operational, device, and business data into trusted dashboards, KPI reporting, and actionable insights across sports technology and enterprise analytics domains. Expertise in SQL, Python, Snowflake, Amazon Redshift, PostgreSQL, Power BI, and Tableau to support data modeling, ETL/ELT pipelines, ad-hoc analysis, data quality monitoring, and self-service reporting. Proven impact includes 45% faster data refresh, 40% fewer ad hoc reporting requests, 30% fewer reporting errors, and 35% less manual reconciliation through automation and standardized metrics. Experienced in requirements gathering, stakeholder collaboration, data governance, role-based access, and production observability (Datadog) in AWS cloud environments.

WORK EXPERIENCE

RIDDELL / SIMBEX - Analytics Engineer **Lebanon, NH (Remote) | August 2023 – Present**

- Design and maintain data models and materialized views in **Snowflake SQL**, cutting **data refresh latency by 45%** and enabling **near real-time reporting** with **sub-second query response times**.
- Write **complex SQL** daily (CTEs, **window functions**, joins, aggregations) against **enterprise data warehouses** to deliver **dashboards and reports** used by **5,000+ stakeholders** across product, engineering, and business teams.
- Built **30+ standardized, reusable reporting modules** with **consistent metric definitions**, reducing **ad hoc reporting requests by 40%** and enabling **self-service analytics**.
- Built an end-to-end data pipeline in **Python and PostgreSQL** to ingest, decode, and load **binary log data from field devices**, with batching for large datasets and **automatic retry handling** for unreliable connections.
- Performed **exploratory data analysis (EDA)** and **trend analysis** on device usage and failure data, surfacing usage patterns and failure trends that informed product and engineering decisions.
- Implemented **automated data quality monitoring** and **validation checks** (null checks, duplicate detection, **row-count reconciliation**), reducing **reporting errors by 30%** quarter over quarter.
- Consolidated **12+ dashboards** into a centralized, **role-based access (RBAC)** reporting layer, cutting **compliance escalations by 40%** and strengthening **data governance**.
- Act as the liaison between business stakeholders and engineering teams, gathering requirements, defining **KPIs and metrics**, and translating needs into **data models and pipeline logic**.
- Performed **root cause analysis** on data anomalies and pipeline failures, tracing issues across source systems and partnering with engineering to resolve them before they reached reporting.
- Designed a three-tier Datadog observability dashboard (system-wide, per-endpoint, per-team) to detect anomalies in **API call volume, latency, and error rates** across a fleet of field devices.
- Documented data dictionaries, metric definitions, and source-to-target mappings in Confluence, and tracked analytics work in Jira within an Agile delivery model.
- Built data validation tests with **pytest** and maintained SQL and Python code in **Git / Bitbucket**, supporting **CI/CD** releases through **Jenkins**.
- Provisioned **EC2, IAM, and RDS** resources with **Terraform** and contributed to infrastructure pull requests (**Nginx** routing, **Ansible** playbook refactoring, release cleanup automation) across non-production **AWS** environments.

VISION QUEST SOLUTIONS - Data Analyst **Bangalore, India | January 2020– December 2021**

- Led the integration of data from 5+ enterprise sources (APIs, flat files, relational databases) into a **centralized reporting hub** using **SQL, Python, and Power BI**.
- Built **ETL workflows** to land raw files in **Amazon S3**, transform them, and load curated tables into **Amazon Redshift** for **downstream analytics**.
- Designed **dimensional data models** (**star schema** with **fact and dimension tables**), defining primary and foreign keys, data types, and **grain** across source systems.
- Built interactive Power BI dashboards with DAX measures, drilldowns, and filters to track **system health and compliance KPIs** for **200+ internal stakeholders**, reducing **manual reconciliation time by 35%**.
- Translated **business requirements** and **source-to-target mappings** into tested **transformation logic**, working with business users to clarify definitions and edge cases.
- Implemented **data quality checks** in **Python and SQL** (null checks, duplicate detection, row-count reconciliation) before data reached reporting layers.
- Performed **data cleaning, transformation, and ad-hoc analysis** in **SQL, Python (Pandas), and Advanced Excel** (pivot tables, lookups) to answer business questions and support **operational reporting**.
- Created **reusable SQL templates** for **root-cause investigations**, cutting analytical turnaround time **by 25%** and tuned **SQL queries** and pipeline logic to achieve sub-200ms dashboard refresh latency for 200+ daily users.
- Coordinated with **external vendors** and internal teams to define **file formats, delivery schedules, and data contracts** for incoming data feeds.
- Tracked **integration milestones, risks, and dependencies** in **Jira**, and shared **status updates** with business and technical stakeholders.
- Maintained data dictionaries, data lineage notes, and pipeline documentation in **Confluence**, and managed SQL and Python code in **Git**.

TECHNICAL PROJECTS

Fleet Health Monitoring Dashboard (Python, PostgreSQL, Streamlit, Soracom API, Datadog API, Plotly)

- Built a Python pipeline that pulls cellular SIM status (Soracom API), device log activity (Datadog API), and login, firmware, check-in, and impact-event data (PostgreSQL), then merges them into one health dataset for 110+ base stations.
- Fetched the API sources in parallel and aggregated check-in counts, signal strength (RSSI), and event latency over 24-hour and 7-day window.
- Delivered a Streamlit dashboard with KPI summaries, filters by org, health, and firmware, grid and table views, and 7-day Plotly trend charts per device, cached on a 15-minute refresh.

NXT Log Analysis Tool (Python, SQL)

- Built analysis tooling on top of the ingested device data to surface usage patterns and failure trends for engineering and product teams.
- Wrote reusable SQL queries and Python summaries that replaced manual log review and sped up root cause analysis.

RDS Provisioning Module (Terraform, AWS)

- Built a reusable Terraform module for PostgreSQL on AWS RDS from scratch (35 input variables, outputs, README), adding encryption, backup, storage and monitoring settings after comparing it against live production and non-production instances through the AWS CLI.
- Tested create (6-13 min) in-place update (~1.5 min) and destroy (~2 min) on a live dev instance, confirming settings changes update the database without recreating it.
- Revised the module through two rounds of code review, adding write-only password arguments (so the password never lands in Terraform state) and a snapshot-restore precondition, and configured the dev environment to match non-prod.

EDUCATION

New Jersey Institute of Technology - Newark, NJ, USA
Master of Science in Information Systems
Gudlavalleru Engineering College - Gudlavalleru, India
Bachelor of Technology in Computer Science

TECHNICAL SKILLS

- **Languages:** SQL, Python
- **Data Engineering:** ETL/ELT pipeline design, data integration, data ingestion, data transformation, data modeling (star schema, dimensional modeling), data warehousing, data lakes, data flows, data architecture, materialized views, dbt, Apache Airflow, Spark
- **AWS Cloud:** Amazon Redshift, S3, AWS Glue, Athena, Lambda, EC2, IAM, RDS, CloudWatch
- **Databases:** Snowflake, Amazon Redshift, PostgreSQL, MySQL, Google BigQuery
- **Integrations & APIs:** REST APIs, file-based integrations (CSV, JSON, flat files), FastAPI, Pydantic, Model Context Protocol (MCP)
- **Data Quality & Governance:** Data validation, data reconciliation, data dictionaries, source-to-target mapping, role-based access, pytest, automated monitoring
- **DevOps & Observability:** Git, GitHub, Bitbucket, Jenkins, CI/CD, Terraform, Ansible, Datadog
- **BI & Analytics:** Power BI, Tableau, Advanced Excel
- **Methodologies:** Cross-functional program delivery, requirements gathering, vendor and partner coordination, roadmap planning, Agile, Jira, Confluence
